UL Verification Services Inc. tested the above equipment in accordance with the requirements set forth in the above standards. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

The results documented in this report apply only to the tested sample, under the conditions and modes of operation as described herein. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical components. All samples tested were in good operating condition throughout the entire test program. Measurement Uncertainties are published for informational purposes only and were not taken into account unless noted otherwise.

This document may not be altered or revised in any way unless done so by UL Verification Services Inc. and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL Verification Services Inc. will constitute fraud and shall nullify the document. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the Federal Government.

2. TEST METHODOLOGY

The tests documented in this report were performed in accordance with EN 303 396.v1.1.1 as referenced by Draft EN 305 550 v2.1.0 as referenced by Test Plan 12511671-TP1V2.

3. FACILITIES AND ACCREDITATION

The test sites and measurement facilities used to collect data are located at 47173 Benicia Street, Fremont, California, USA.

The test sites and measurement facilities used to collect data are located at 47173 and 47266 Benicia Street, Fremont, California, USA. Line conducted emissions are measured only at the 47173 address. The following table identifies which facilities were utilized for radiated emission measurements documented in this report. Specific facilities are also identified in the test results sections.

4. CALIBRATION AND UNCERTAINTY

4.1. MEASURING INSTRUMENT CALIBRATION

The measuring equipment utilized to perform the tests documented in this report has been calibrated in accordance with the manufacturer's recommendations and is traceable to recognized national standards.

4.2. MEASUREMENT UNCERTAINTY

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus:

PARAMETER	UNCERTAINTY
Radio Frequency	±3.5 x 10^(-8)
Radiated RF power (up to 40 GHz)	±5.3 dB
Radiated RF power (above 40 GHz up to 66 GHz)	±5.1 dB
Radiated RF power (above 66 GHz up to 100 GHz)	±5.4 dB
Radiated RF power (above 100 GHz)	±5.64 dB
Temperature	±0.9 deg C
Humidity	±4.5 % RH
DC and low frequency voltages	±0.45 %

Uncertainty figures are valid to a confidence level of 95%.

5. EQUIPMENT UNDER TEST

5.1. DESCRIPTION OF EUT

See Test Plan 12511671-TP1V2.

The IWR6843ISK is a 60 to 64 GHz mmWave radar sensor development board with integral high-gain (~7 dBi) antennas on the printed circuit board.

The MMWAVEICBOOST is an interface board.

5.2. OUTPUT POWER

The Mean Output Power in the 300 MHz BW mode is 7.65 dBm (5.8 mW) EIRP .

The Mean Output Power in the 1300 MHz BW mode is 11.44 dBm (13.9 mW) EIRP.

The Mean Output Power in the 4000 MHz BW mode is 10.59 dBm (11.5 mW) EIRP.

5.3. SOFTWARE AND FIRMWARE

The software used on the support laptop is mmWave Studio 2.0.0.2 and the DFP package is mmwave_dfp_01.02.00.01 for the xWR6843 series.

Three test scripts with 300 MHz, 1300 MHz and 4000 MHz operating bandwidths, transmitting maximum power were provided and used at all RF tests.

Three Modes for 300, 1300, and 4000 MHz bandwidths were tested for Receiver Interference Handling using Texas Instruments mmWave_Demo.Visualizer ver 3.1.0 software.

All horn antennas at and above the 33-50 GHz band are standard gain horns. In accordance with ANSI C63.10 clause 4.4.3 (a) Standard gain horns need not be periodically recalibrated, unless damage or deterioration is suspected or known to have occurred. If a standard gain horn is not periodically recalibrated, then its critical dimensions (see IEEE Std 1309-2005) shall be verified and documented on an annual basis.

UL measures the critical dimensions on an annual basis and checks for damage and deterioration before each test.

7. APPLICABLE LIMITS AND TEST RESULTS

All Tests were conducted within an environmental range of +15°C to +35°C; 20% to 75% RH per EN 303 396 v1.1.1 clause 4.4.3.1.

7.1. DUTY CYCLE

LIMIT

None, for reporting purposes only.

TEST PROCEDURE

EN 303 396 Clause 6.3.6.3 Oscilloscope method

The total Duty Cycle is calculated as the duty cycle across bursts multiplied by the duty cycle within each burst.

The duty cycle factor is calculated as:

Duty Cycle Factor (dB) = 10 * Log (1 / x)
Where X = Duty Cycle (linear)

122,25 GHz to 123 GHz	No limit defined	Non-specific SRD	
244 GHz to 246 GHz	No limit defined	Non-specific SRD	
NOTE 1: These limits should be measured with an rms detector and an averaging time of 1 ms or less. NOTE 2: The limit of -48 dBm/MHz applies for the normal operation mode of handheld and mobile devices and for fixed installation. NOTE 3: See for declaration requirements, clause 5.2.			

TEST PROCEDURE

EN 303 396 Clause 6.3.5

Test Plan 12511671-TP1V2

The fundamental signal is measured in the far-field of both the EUT and measurement antennas, under Normal environmental conditions.

Substitution testing with a CW source connected to a variable attenuator and standard gain horn is used to determine the EIRP corresponding to an uncorrected measured reference power of 0 dBm. The conducted output power of the Source + Variable Attenuator is measured with a power sensor. The Substitution EIRP is calculated as the conducted output power + TX Antenna Gain.

The difference between Substitution EIRP and 0 dBm is used as the Correction Factor for the EUT measurement.

This Correction Factor inherently consists of the Over-The-Air Path Loss, the RX Measurement Antenna Gain, the Downconverter Conversion Loss and the IF amplifier gain.

This Correction Factor is added to the uncorrected measured EUT power to calculate the EIRP of the signal under test.

FAR FIELD BOUNDARY

The far-field boundary is given as:
$R_{far\ field} = (2 * L^2) / \lambda$
where:
L = Largest Antenna Dimension, in meters
λ = wavelength in meters

TEST PROCEDURE

EN 303 396 Clause 6.3.4

Test Plan 12511671-TP1V2

The fundamental signal is measured in the far-field of both the EUT and measurement antennas, under Normal environmental conditions.

The far-field boundary is calculated above in Power Density.

Substitution testing with a CW source connected to a variable attenuator and standard gain horn is used to determine the EIRP corresponding to an uncorrected measured reference power of -30 dBm. The conducted output power of the Source + Variable Attenuator is measured with a power sensor. The Substitution EIRP is calculated as the conducted output power + TX Antenna Gain.

The difference between Substitution EIRP and -30 dBm is used as the Correction Factor for the EUT measurement.

This Correction Factor inherently consists of the Over-The-Air Path Loss and the RX Measurement Antenna Gain.

This Correction Factor is added to the uncorrected measured EUT power to calculate the EIRP of the signal under test.

Note: Since the Mean Power measurement does not utilize a Downconverter or IF amplifier, (1) a lower uncorrected reference power is chosen for the Mean Power substitution measurement than for the Power Spectral Density substitution measurement and (2) the correction factors for these two measurements are noticeably different.

RESULTS

BW Mode	Center Freq. (GHz)	Meas. Power (dBm)	Meas. Dist. (m)	Correction Factor (dB)	Mean Power (dBm EIRP)	Power Limit (dBm EIRP)	Margin (dB)	Mean Power (mW EIRP)

7.6. RADIATED SPURIOUS EMISSIONS

LIMIT

EN 305 550 Clause 4.3.6.3

Frequency range (MHz)	Limit values for spurious radiation	Detector type
47 to 74	-54 dBm e.r.p.	Quasi-Peak
87,5 to 118	-54 dBm e.r.p.	Quasi-Peak
174 to 230	-54 dBm e.r.p.	Quasi-Peak
470 to 862	-54 dBm e.r.p.	Quasi-Peak
otherwise in band 30 to 1 000	-36 dBm e.r.p.	Quasi-Peak
f > 1 000 to 300 000 (note)	-30 dBm e.i.r.p.	RMS
NOTE: According to CEPT/ERC/REC 74-01 [i.3], spurious emission is measured up to the 2nd harmonic of the fundamental frequency.		

TEST PROCEDURE

EN 303 396 Clause 6.3.10

Note: Peak detection used for prescan, identification of emissions, and maximizing signals. Quasi Peak and Average detection used for final measurements.

PROCEDURE FOR 30 MHz TO 50 GHz

Measurements are made with the antenna feeding a spectrum analyzer via a preamplifier and cables.

PROCEDURE FOR 50 TO 128 GHz

External mixers or downconverters are utilized.
